

Distribution of maximum macro-F1 by target synthesis method

Grouped by approach, showing overall means and difference

Adult counted once. Purple: joint CTGAN/TVAE; teal: decoupled labeling. Circles and red dashed lines show approach means. Only joint TVAE Covertypes changes from 0.2972 to the paper's 0.433; all other scores remain fixed. Points are dataset/configuration summaries, not independent seeds. P values: paired t tests across four tasks. Paper protocols differ; substitution is hypothetical. Test selection and known leakage concerns remain.
